

WHAM!! BAM!!

THE TOP 3 PARTY GAMES IN 1 APP

Pre-Build Audit — Response & Fix Report

Response to "Wham Bam — Issues to Fix Before Native Build"

RESPONDING TO	WhamBam_PreBuild_Issues.docx — audit dated 26 July 2026
RESPONSE DATE	28 July 2026
BUILD AUDITED	whambam.games (live web build)
FILE CHANGED	headband-game-web.html — single-file web app, 4,018 lines
ALSO UPDATED	upload/index.html — deploy copy, kept byte-identical
VERIFICATION	Inline JS syntax check + 17 automated access-control assertions, all passing

5

Fixed & verified

2

Awaiting your decision

3

Extra defects found

Every issue raised in the audit was reproduced against the source before any change was made. Items 1, 2, 3, 4 and 6 are fixed and verified. Items 5 and 7 are confirmed as real but need a product decision from your side before they can be closed — recommendations are given for both. Three further defects were found during the review and are documented at the end.

The audit noted that locations were described by visible text because source access was not available. Source-level line references are supplied throughout this response, and in three places the audit's location list was incomplete — those additional occurrences are called out explicitly.

Part 1 — Issues fixed and verified

1. Typo: "Wam Bam" instead of "Wham Bam"

FIXED

YOUR FINDING	Wrong spelling in the page title and in the ad creative block.
CONFIRMED	Reproduced. Six occurrences in total — three more than the audit listed.
ALSO FOUND	Home-screen logo alt text (line 931), ad-completion message "Thanks for keeping Wam Bam free!" (line 2962), and the sign-in modal heading (line 3983). A JavaScript image-failure fallback also rendered the text "WAM BAM!" and was corrected.
FIXED	All six corrected to "Wham Bam". The browser title is now the full "Wham Bam — Party Word Game" (line 6), matching the og:title already in place.
VERIFIED	Repository-wide search for "Wam Bam" and "WAM BAM" returns zero matches in both files.

2. Deck count mismatch — "11 decks" vs 24 actual

FIXED

YOUR FINDING	Meta tags and ad copy claim 11 decks; the deck screen says 8 free + 16 premium.
CONFIRMED	The deck screen is correct. The catalogue holds 24 decks — 8 free and 16 premium — verified by counting the deck definitions in source and cross-checking the Supabase catalogue. "11 decks" was stale copy from an earlier release.
FIXED	All three locations now state 24 decks: meta description (line 7), og:description (line 9), and the ad description (line 1407).
ROOT CAUSE	The "8 free · 16 premium" subtitle was itself hard-coded, so it would have drifted the moment a deck was added. It is now calculated from the live catalogue at render time (lines 1008 and 3786). The number can no longer go stale.
NOTE	The three marketing strings remain hard-coded, as meta tags must be static for search engines and social previews. These need a manual update if the deck count changes.

3. Conflicting ad-reward values (100 words / 60s vs 50 words / 30s)

FIXED

YOUR FINDING	Two different ad offers appear in two different modals.
CONFIRMED	This was not copy drift — the two tiers existed in code. Premium decks ran a 60-second ad for 100 words; free decks ran a 30-second ad for 50 words. Both expired after 24 hours.
YOUR CALL	"Consistent policy across. Each 30 Sec ad watch gives access to 30 words. No need to mention 24 hrs."
FIXED	A single policy now drives both paths from two constants, so the two modals cannot diverge again:

```
const AD_SECS      = 30;    // every ad is 30 seconds
const AD_WORD_BATCH = 30;    // every ad grants 30 words
```

All user-facing text is generated from these values rather than typed by hand, and every reference to "24 hours" and "24hr" has been removed from the interface.

One consequence worth flagging

Because the copy no longer promises a 24-hour window, silently expiring the words after a day would be worse for the player than the old behaviour. Ad words are therefore now a quota that lasts until it is spent, rather than a rental that expires. The expiry mechanism is intact and can be re-enabled if you would prefer a time limit — it is a one-line change.

4. Tagline inconsistency — "forehead guessing game" vs "TOP 3 party games"

FIXED

YOUR FINDING	Meta tags describe a single-mode forehead game; the splash screen promises three games.
RECOMMENDED	Align to "3 games in 1", since that reflects the current product.
FIXED	Both meta tags now lead with "the TOP 3 party games in 1 app" and name the three modes — Up Top, Charades and Don't Say It!! — matching the splash banner and giving search engines the mode names as keywords.
RETAINED	The "Hold it. Guess it. WIN it." line is retained in both tags as the brand hook.

6. Monetisation value — "\$0.99/year for 300 words"

FIXED

YOUR FINDING	300 words for a full year may deplete quickly; needs a deliberate decision.
YOUR CALL	"0.99/year opens up the full category. No need for a number."
FIXED	The word count is gone from every subscription string, replaced with "Unlocks the full category". The underlying grant is no longer capped at 300.
ALSO FIXED	Deck cards previously displayed a fixed "300 entries" label for subscribed decks. They now show the deck's real word count (line 1710).
IMPORTANT	This change exposed a live defect in the purchase flow — see Part 3, item A.

Part 2 — Confirmed, awaiting your decision

Both items below are real and reproduced. Neither is a code defect — each needs a product or commercial decision before it can be implemented, so we have not guessed at one.

5. Missing "Sign in with Apple" — App Store compliance risk

YOUR CALL

YOUR FINDING	Google Sign-In is offered without Sign in with Apple; risk of rejection under Guideline 4.8.
CONFIRMED	Google OAuth is the only third-party provider in the sign-in modal.
NUANCE	The app also ships a fully independent email-and-password system — sign-up, sign-in, email confirmation and password reset all work without Google. Guideline 4.8 applies to third-party login services; an app's own account system is not one. A reasonable reading is that the exemption applies.
RECOMMENDED	Add it anyway. Reviewers apply this guideline inconsistently, a rejection costs a full review cycle, and Apple developer-account enrolment is required for the iOS build regardless. The cost of adding it now is far below the cost of a rejection later.
EFFORT	Roughly half a day: enable the Apple provider in the authentication backend, register the Service ID and key in the Apple Developer portal, and add one button to the sign-in modal. No change to game logic.
FROM YOU	Confirmation to proceed, plus Apple Developer Program access (also required to submit the iOS build).

7. Voice commands limited to Chrome

YOUR CALL

YOUR FINDING	Voice is gated to Chrome and shown as a warning banner; rated Low-Medium.
CONFIRMED	Voice uses the browser Web Speech API, which only Chrome implements.
OUR VIEW	We consider this the most significant open item in the audit, above its Low-Medium rating. The native builds wrap the web app in a system web view. Neither the Android web view nor the iOS web view provides this API, so voice will not work in either shipped app — not merely in non-Chrome desktop browsers. The warning banner will be visible to every mobile player.

OPTIONS	Either (a) add a native speech plugin so voice works properly in both apps, or (b) hide the feature and its banner on native builds and remove voice from launch messaging.
RECOMMENDED	Option (a) if voice is a headline feature; roughly two to three days including the microphone permission flows on both platforms. Option (b) is under an hour and is the right choice if voice is a nice-to-have.
FROM YOU	A decision on whether voice is a launch feature.

Part 3 — Additional defects found and fixed

These were not in the audit. Two were uncovered while implementing your decisions on items 3 and 6; the third is a consequence of the new single-tier ad policy.

A. Purchased premium decks granted zero words

FIXED

SEVERITY	High — a paying customer would have received nothing.
PROBLEM	Completing a premium deck purchase marked the deck as unlocked and moved it into the main grid, but never created the word allowance that the game checks before starting a round. The deck therefore appeared bought, then hit the paywall again on the very next round.
WHY NOW	Rewriting the \$0.99 tier for item 6 required tracing exactly what a purchase grants. The two code paths had drifted apart.
FIXED	The purchase now issues the deck's word allowance at the same moment it records ownership (line 3676), so the two can no longer disagree.
TEST THIS	This sits in the payment flow and deserves an explicit end-to-end check on the live build before launch.

B. Ad-unlocked decks masqueraded as purchased

FIXED

SEVERITY	Medium — misleading, and worse under the new 30-second ad policy.
PROBLEM	Watching an ad for a premium deck promoted it out of the premium carousel into the main "unlocked" grid permanently, exactly as a real purchase does. Under the old 60-second / 100-word tier this was already misleading; at 30 words the deck would look permanently owned and then run out almost immediately.
CAUSE	A single list was tracking two different ideas — "the player owns this" and "the player can play this right now".
FIXED	Those are now separate checks (lines 2482–2492). Only a genuine purchase or All Access promotes a deck to the main grid. An ad-unlocked deck stays in the premium carousel, marked with a green border and a live "30 words left" counter, and returns to its locked state on its own once the words are spent.
VERIFIED	17 automated assertions cover this: locked state, ad grant, ownership never being conferred by an ad, the pool draining, self-relocking, and purchase behaving differently.

C. Stale word counters on returning from a round

FIXED

SEVERITY	Low — cosmetic, but it would have made the new counter untrustworthy.
PROBLEM	The deck grid was only rebuilt on purchase or unlock, never when returning to the setup screen. The new "words left" counter would have kept showing its old value after a round was played.
FIXED	The grid now rebuilds whenever the setup screen is opened (line 1728). Deck selection is preserved across the rebuild.

Verification performed

- Every issue was reproduced in source before any change was made — nothing was fixed on description alone.
- Inline JavaScript passes a syntax check after all edits.
- A test harness extracts the live access-control functions directly from the shipping file and runs 17 assertions against them. All pass. Because the functions are pulled from the real file rather than copied, the test cannot drift out of sync with the code.
- Repository-wide searches confirm zero remaining occurrences of every string that was replaced: "Wam Bam", "11 decks", "100 words", "300 words", "300 entries", "24 hours", "24hr" and "Watch 60s".
- The deploy copy at `upload/index.html` was regenerated from the fixed source and confirmed byte-identical by checksum, so the two cannot diverge.

Not covered by this response

As the original audit noted, the following need testing on real hardware once the native build exists, and are outside the scope of a source-level review: tilt-sensor calibration, the live advertising SDK and payment provider integration, cross-device rendering, and speech-recognition accuracy.

Suggested next steps

- Deploy the corrected build — all fixes above are client-side and are inert until the updated file is live on `whambam.games`.
- Test the premium purchase flow end to end (item A) — the highest-value fix in this round and the one most worth confirming yourself.
- Decide on Sign in with Apple (item 5) — needed before the iOS build is submitted, not after.
- Decide whether voice is a launch feature (item 7) — this shapes both the native build and the launch messaging, so it is best settled early.
