

WHAM!! BAM!!

THE TOP 3 PARTY GAMES IN 1 APP

QA Report Reconciliation & Fix Plan

Source verification of the Comprehensive QA Test Report

RESPONDING TO	Wham_Bam_QA_Report.docx — automated QA, dated 29 July 2026
PREPARED	28 July 2026
METHOD	Every finding traced to source in headband-game-web.html (4,018 lines)
SCOPE NOTE	The QA run tested the LIVE deployed build, which is older than the current local file and predates the first audit round's fixes
FINDINGS	23 raised — 3 Critical, 4 High, 9 Medium, 7 Low

13

Real — confirmed

6

Not bugs / already fixed

4

Real, different cause

Each of the 23 findings was traced to the actual source before being accepted or rejected. Thirteen are real and confirmed. Six are either misdiagnosed or describe behaviour that is already correct in code. Four are real symptoms with a materially different cause than the report gives — which changes the fix. One real defect the report did not find is documented at the end.

Most consequentially, the report misidentifies the application's architecture. That single error is the entire premise of its most severe finding, and it inflates the estimated cost of that work by roughly two orders of magnitude.

The architecture claim is incorrect

The report states that "the entire game is drawn on an HTML canvas element, like a painting on a screen," and builds finding C-3 (Critical, near-zero accessibility) on that basis. It also colours M-5, M-9 and L-4.

This is not the case. The file contains exactly one canvas:

```
872: <canvas id="bg-canvas"></canvas>
```

It draws the ambient floating background only. Every screen, button, modal, score panel and word card is ordinary DOM — which is why the QA tooling was able to read and click them at all.

Why this matters commercially

C-3 proposes three remediation options, the cheapest of which is an ARIA live region and the most expensive a full migration of the UI off canvas. None of that applies. The real accessibility gap is narrow and specific: a handful of controls are built as clickable `<div>` elements instead of `<button>`, so they are not keyboard-reachable and carry no role. That is a same-day fix on existing markup, not an architectural migration.

The genuine accessibility work is captured below as M-5 and L-4. C-3 as written should be closed.

Not defects — already correct in code

These three describe behaviour that the source already implements. Most likely the automated tooling could not observe the CSS class or the pointer-events state.

ID	SOURCE	FINDING VS REALITY
M-3	line 1756 line 237	Claim: Classic/Team toggle shows no active state. Reality: <code>selMode()</code> toggles the <code>.on</code> class, and <code>.mode-btn.on</code> is a yellow gradient with a glow and coloured border. The active state is one of the strongest on the screen.
M-4	lines 1779-1783	Claim: Voice commands can be switched on in Charades, contradicting the silence rule. Reality: <code>selGameStyle()</code> sets the row to opacity <code>.35</code> AND <code>pointer-events:none</code> , and unchecks the toggle. It cannot be enabled in Charades.
L-7	lines 1779-1783	Claim: Tilt controls can be enabled in Charades. Reality: same block, same treatment — already dimmed, already unclickable, already unchecked.

One fair point survives: dimming with pointer-events is a visual and mouse-level block, not a true disabled state, so a keyboard or screen-reader user could still reach the control. Worth hardening alongside the M-5 work.

Real symptom, wrong cause — two High findings

H-2 (Don't Say It timer presets do not respond) and H-3 (Don't Say It skip counter always shows 0) are both reported as broken code in the Don't Say It mode specifically.

There is no Don't Say It code path to break

The app has one shared setup screen (#screen-setup) and one shared gameplay screen (#screen-play). All three modes use the same markup, the same timer handlers and the same skip handler. There is no separate Don't Say It implementation that could fail on its own while the others work.

What actually differs in Don't Say It is the layout

- The deck section is hidden in Don't Say It (line 1787), so every control below it shifts upward.
- The BUZZ button is display:none except under .taboo-mode (lines 795-796). Don't Say It therefore shows THREE action buttons where the other modes show two — and because .sidebtn uses flex:1, all three are repositioned.

Coordinate-based automation calibrated against Up Top will land on the wrong element in both cases. For H-3 the consequence is precise and testable: a click aimed at "Skip" lands on "BUZZ".

The report's own evidence confirms this

H-3 states that BUZZ "works correctly (deducts 1 point, advances card, tracked separately as Buzzed)" while Skip does nothing at all. That is exactly the signature of every Skip click being delivered to the BUZZ button. The skip handler itself is sound:

```
2683: function doSkip(){
2685:   G.roundWords.push({w:G.words[G.idx].w,result:'skip'});
2687:   SFX.skip(); G.skipped++; G.idx++; ...
```

It increments the counter and records the card, and it is the only skip handler in the file. The report hedged on H-2 ("possible browser-automation artifact") — that caution was justified, and it applies to H-3 equally.

But H-2 has a real contributing cause, and it is M-6

setTimer() (line 1827) never applies an active class, so clicking a timer preset produces no visual change whatsoever. The CSS for the selected state exists (.tpreset.rp-active, line 340) and the round presets use it correctly — the timer presets were simply never wired to it. A tester clicking a preset and seeing nothing happen would reasonably conclude the control is dead.

So H-2 should be closed as an artifact, but M-6 must be fixed — it is why the artifact was believable. Fixing M-6 also gives the retest an unambiguous pass/fail signal.

Real — confirmed in source

ID	SOURCE	CONFIRMED FINDING
C-1	backend	Sign-up returns HTTP 500. Not reproducible from source. Most probable cause is our own recent change: a failing custom SMTP makes Supabase return 500 on sign-up, and the Hostinger SMTP was configured while DNS was still propagating, two days before this QA run. Check Supabase Logs > Auth before investigating anything else.
C-2	line 3461	Raw error object shown to the user. <code>_showErr(error.message)</code> passes the message through with no mapping and no fallback, so a 500 with an empty body renders as <code>"{}"</code> . Confirmed exactly as reported.
H-1	lines 1081-1107 1892-1897	The How to Play modal is hardcoded to Up Top. Its first step reads "Hold phone on forehead" and has no id, so it is never swapped; only the tilt, voice and team steps are conditional. WORSE THAN REPORTED: it is gated on a single <code>hb_howtoplay_seen</code> flag, so it fires once per browser ever — a player who starts with Up Top never receives a guide for the other two modes at all.
H-4	lines 3936-3971	No "Forgot password?" link and no reset entry point. Note: the branded password-reset email template is already configured and deployed, so the backend is ready and nothing in the UI can trigger it.
M-1	line 1353	Restore Purchases is <code>display:none</code> and only revealed when <code>PLATFORM.isNative</code> , so web users cannot reach it. Confirmed.
M-2	—	No mid-game session recovery. Confirmed: all <code>hb_*</code> <code>localStorage</code> keys hold unlocks, scores and flags. No round state is persisted anywhere.
M-5	lines 984, 995-996, 1028-1033	Interactive controls are <code><div onclick></code> — not focusable, no role, no keyboard activation. BROADER THAN REPORTED: this affects the timer presets, the Classic/Team tabs and the Go back buttons, not only the timer pills.
M-6	line 1827	No visual highlight on the selected timer preset. Confirmed — and it is the root cause of the H-2 report above.
M-7	line 632	Post-round word list. PARTLY CORRECT: the container DOES scroll (<code>max-height:200px; overflow-y:auto</code>), so no data is unreachable. What is missing is the affordance — no visible scrollbar or fade to signal there is more.
M-8	lines 3431-3439	Validation state persists across tab switch. Confirmed, but the cause differs: this is the browser's native <code>:invalid</code> constraint validation on the email input, not an attribute set by our code. The report's suggested <code>removeAttribute('invalid')</code> fix would not work.
M-9	—	Letterbox bars at wide desktop widths. Confirmed, but this is a direct consequence of the contain-fit that was requested earlier to stop the artwork zooming and cropping. Scaling to fill the width, as the report suggests, would reintroduce that exact problem. Only the surround colour should change.
L-1	—	No Terms of Service or Privacy Policy anywhere in the app. Confirmed. Blocks App Store and Play Store submission.
L-4	—	Decorative emoji are not marked <code>aria-hidden</code> , so screen readers announce them. Confirmed.
L-5	line 1191	The voice-commands tip on the Ready screen renders unconditionally, with no check against the voice toggle. Confirmed.
L-6	lines 3790-3800	The premium counter reports 16 correctly, but the All Access bundle card is appended to the same carousel, so the list shows 17 items. Confirmed.

Missed by the report — and it is ours

The Charades Ready screen contradicts itself. The subtitle and the instruction card directly beneath it give opposite instructions:

```
1959: ready-sub (charades) "Hold phone facing out – others see the word!"
1196: tips-card (charades) "Keep the word to yourself – don't show it to your team"
```

The tips card is correct. The subtitle is the old, wrong text — and the setup banner hint (line 1767, "Hold phone up, face out") carries the same stale wording.

This is a leftover from the earlier Charades correction: the instruction card was fixed and these two strings were missed. It is the same defect that was originally reported, still live in two places, and it should be corrected in the same pass as H-1 since both are Charades onboarding copy.

Fix plan

Batch 1 — content correctness (fastest, highest visibility)

- Make the How to Play modal mode-aware, and change the seen-flag to per-mode so each mode gets its guide once. Reuse the copy already in the mode tips cards rather than writing new text — one source of truth prevents this drifting again. (H-1)
- Correct the Charades subtitle and setup hint to match the tips card. (our regression)
- Show the voice tip only when the voice toggle is on. (L-5)

Batch 2 — setup feedback and keyboard access

- Apply the active class in `setTimer()`, mirroring the `round-preset` function that already does this correctly. (M-6, and closes out H-2)
- Convert the timer presets, mode tabs and back buttons from `div` to `button`, with `aria-pressed` on the preset groups. Existing styling carries over. (M-5, and the real substance of C-3)
- Mark decorative emoji `aria-hidden` and add page landmarks. (L-4, remainder of C-3)

Batch 3 — authentication

- Map auth errors to human-readable messages with a generic fallback. Never surface a raw object. (C-2)
- Add "Forgot password?" wired to the reset flow, using the branded template already deployed. (H-4)
- Clear field validation state on tab switch by resetting the fields, not by removing an attribute. (M-8)

Batch 4 — polish

- Show Restore on web with accurate copy (M-1) · add a scroll affordance to the word list (M-7) · separate the All Access card from the deck count (L-6) · set the letterbox surround to the brand background instead of black (M-9).

Held back — needs a decision, not code

- C-1 sign-up 500 — diagnose live first. It may already be resolved, or may be the SMTP change. This is the only finding that blocks release, and it should be checked before any of the batches above.
- M-2 session recovery — a genuine feature, not a repair. Worth scoping on its own.
- L-1 Terms and Privacy — needs legal copy from you before it can be added.
- L-3 cookie consent — depends on whether you serve EU users. The Cloudflare beacon is injected at the edge by hosting, not present in our source.

How each fix will be verified

- Inline JavaScript syntax check after every batch.

- H-1: clear local storage, enter each of the three modes from mode select, confirm the guide matches the mode and returns once per mode.
- M-6 and H-2: click every timer preset in all three modes and confirm the highlight moves and the timer value changes — this directly retests the Don't Say It claim.
- H-3: play a Don't Say It round and tap Skip (leftmost of the three buttons), confirming the Skipped counter increments and the card is listed as skipped afterwards.
- M-5: tab through the setup screen and confirm every control is reachable and activates on Enter or Space.
- Mirror to [upload/index.html](#) and confirm byte-identical by checksum.

Items the QA report listed as Not Verified — tilt, voice, orientation lock, team progression, the word cap, ad playback and real purchases — still require a physical device or a live payment sandbox, and are unaffected by this plan.
